# Annual Fish Passage Report - Rock Island Dam Columbia River, Washington, 1964

By

PAUL D. ZIMMER and JOHN H. BROUGHTON

## ABSTRACT

Fish using the three fishways at Rock Island Dam in 1964 were counted from May 1 to October 24. The total number of salmon and steelhead trout exceeded the 1963 count by 7,885 fish.

The 1964 count of 39,951 chinook salmon was more than twice the mean of 17,355 for the 31-year period 1933-63 and exceeded the 1963 count by 5,263 fish. The 69,411 sockeye salmon counted was 4,643 more than recorded in 1963 and exceeded the 31-year mean of 51,603. The 61 coho salmon counted was about 75 percent of the 31-year mean of 81 and 8 percent of the record count of 737 in 1962. The 5,016 steelhead trout count in 1964 was well above the 31-year mean of 3,457 and 2,062 less than in 1963. Fish other than salmon and steelhead trout passing through the fishways at Rock Island Dam in 1964 numbered 118,284 and exceeded the count of salmon and steelhead trout by 3,845 fish.

Of the 114,439 salmon and steelhead trout observed at Rock Island Dam in 1964, about 2 percent had visible evidence of injury about the head or body.

## INTRODUCTION

Rock Island Dam, located on the Columbia River about 12 miles downstream from Wenatchee, Wash., has been in operation since 1933. The plant is owned and operated by Chelan County Public Utility District No. 1.

This report on passage of fish at Rock Island Dam during 1964 provides information on operations of fishways and numbers of fish using them.

Rock Island Dam has three fishways: one located on the right bank, another on the left bank, and the third about the center of the dam. The bank fish ladders began operating in 1933, and the middle ladder in 1936. All three ladders have been modified since then.

Fish ascending Rock Island Dam ladders have been counted annually since 1933, the longest continuous record of Columbia River fish counts.

Included in this report are comments covering various fishery investigations at Rock Island Dam during 1964.

## COUNTING PROCEDURES

Fish counting in 1964 began on May 1 and ended October 24. From May 1 through August 31, fish were counted 16 hours each

day, starting at 5 a.m. and ending at 9 p.m. From September 1 through October 10, counting was reduced to 14 hours each day, starting at 6 a.m. and ending at 8 p.m. to conform with the available daylight. From October 11 to October 24, fish counting was reduced to one shift each day from 8 a.m. to 4:30 p.m.

Fish counters were allowed a 15-minute rest period at the end of each hour. During all periods of noncounting, ladders were closed to fish.

A water glass was floated on the surface over each counting board to eliminate sunglare and water surface disturbances and thus permit clear observation of each fish.

## ENUMERATION OF FISH

All species of fish using the fishways at Rock Island Dam are identified and recorded. Because of their greater importance, special mention is made of the different species of salmon and of the steelhead trout passing the dam, and each is discussed separately.

### Chinook Salmon, *Oncorhynchus tshawytscha*

The 1964 chinook salmon count of 39,951 (jacks included) was more than twice the mean of 17,355 for the 31-year period 1933-63. It was also greater than the 1963 count and about 79 percent of the record count of 50,713 in 1957 (table 1). Monthly totals of chinook salmon given in table 2 show a peak movement of these

---

Note.--Paul D. Zimmer, Fishery Biologist (Management), and John H. Broughton, Fishery Technician, Bureau of Commercial Fisheries Program Office, Portland, Oreg.

fish in August. Maximum day's count of chinook salmon (jacks excluded) was 896 on May 5 (table 3), as compared to 430 on August 5, 1963. Tables 4 and 5 show semimonthly totals of the number and percentage of chinook salmon counted over each ladder. Of the chinook salmon (jacks excluded), 51 percent ascended the left ladder, while 28 and 21 percent ascended the middle and right ladders, respectively. In 1963, percentages of chinook salmon (jacks excluded) which used the left, middle, and right ladders were 73, 14, and 13, respectively.

Table 3.--Maximum daily counts, salmon and steelhead, Rock Island Dam, 1964

Species	Date	Number of fish
Chinook (except jacks)	May 5	896
Chinook (jacks). . . .	Sept. 12	257
Sockeye. . . . .	July 27	6,247
Coho . . . . .	Oct. 9, 22	5
Steelhead. . . . .	Sept. 17	129

## Chinook Salmon Jacks

Some chinook salmon return from the ocean as mature fish in the year following their seaward migration and are referred to as "jacks." These fish are small and males predominate. At Rock Island Dam in 1964, all chinook salmon 24 inches or less were counted as jacks. Each counting board has a marked section, 24 inches long, for use of the counter in gaging the length of these small chinook salmon. The maximum daily count of 257 jacks occurred on September 12 (table 3), three days earlier than in 1963. The 14,493 fish recorded as jacks constituted about 36 percent of the total chinook run as compared to 56 percent in 1963.

Table 5 shows the number and percentage of chinook salmon jacks counted over each fish ladder. In 1964, 74, 14, and 12 percent of the jacks used the left, middle, and right ladders, respectively, as compared to 72, 11, and 17 percent in 1963. Monthly totals are given in table 2.

## Sockeye Salmon, *Oncorhynchus nerka* (Blueback or Red)

The sockeye salmon count of 69,411 was about 35 percent greater than the 31-year mean of

<sup>1/</sup> Middle ladder closed from Oct. 14-24 in order to make repairs.

51,603 (table 1) and surpassed the 1963 run by about 4,600 fish. Peak of the run was reached on July 27, when 6,247 fish were counted through the fishways. Peak daily count in 1963 occurred on July 15 when 4,601 fish were recorded.

Table 6 shows semimonthly totals of the number and percentage of sockeye counted over each fish ladder. Of the sockeye salmon passing Rock Island Dam in 1964, 66 percent ascended the left ladder, while 15 and 19 percent ascended the middle and right ladders, respectively. Percentage distribution of sockeye through the left, middle, and right fishways in 1963 was 66, 20, and 14, respectively.

Data pertaining to sockeye salmon daily counts are in tables 9-14. Monthly totals of sockeye counted in 1964, table 2, show 79 percent of the total run passed through the fishways in July, as compared to about 90 percent during the same month in 1963.

#### Coho Salmon, Oncorhynchus kisutch (Silver)

The 1964 coho salmon count of 61 was about 75 percent of the 31-year mean of 81, and slightly more than 8 percent of the peak year

of 737 in 1962 (table 1). The first coho was observed on September 11, 1964, as compared to September 2, 1963. Maximum day's count of 5 occurred on October 9 and 22. Of the coho salmon passing the dam in 1964, 80 percent used the left ladder, while 2 and 18 percent used the middle and right ladders, respectively (table 7). In 1963, percentages of coho were left, 40 percent; middle, 40 percent; and right, 20 percent. Additional data are shown in tables 2, 13, and 14.

#### Steelhead Trout, Salmo gairdneri

The 1964 steelhead trout count of 5,016 was 45 percent greater than the 31-year mean of 3,457 (table 1). In 1964, the greatest number of steelhead passed through the fishways in September when 1,688 were recorded (table 2). Peak monthly movement of these fish in 1963 also occurred in September when 2,634 were counted.

Of the steelhead passing Rock Island Dam in 1964, 76 percent used the left ladder, while 10 and 14 percent ascended the middle and right ladders, respectively (table 8). In 1963, percent utilization by ladder was: left, 76; middle, 8; and right, 16.

<sup>1/</sup> Middle ladder closed from Oct. 14-24 in order to make repairs.

Maximum day's count in 1964 was 129 on September 17 (table 3), as compared to 201 on September 15, 1963. Additional data pertaining to the movement of steelhead trout at Rock Island Dam are contained in tables 9-14.

#### Miscellaneous Fish

In 1964, species of fish passing Rock Island Dam other than salmon and steelhead trout were counted as in former years (tables 15-20). No claims are made as to complete accuracy of identification of these fish; however, the degree of accuracy is consistent with that maintained at other dams on the

Columbia River. Such data should only be used as a rough index of abundance of these fish.

In 1964, 118,284 fish other than salmon and steelhead trout passed Rock Island Dam. This number, as compared to 138,000 in 1963, exceeded the count of salmon and steelhead trout by about 4,000. The species included are largescale sucker, Catostomus macrocheilus; longnose sucker, Catostomus catostomus; squawfish, Ptychocheilus oregonense; Rocky Mountain whitefish, Prosopium williamsoni; Columbia River chub, Mylocheilus caurinus; carp, Cyprinus carpio; lamprey, Entosphenus tridentatus; Dolly Varden trout, Salvelinus malma; and rainbow trout, Salmo gairdneri.

## WEATHER AND RIVER DISCHARGE DATA

Headwater and tailwater elevations are plotted on figures 1 and 2. Air temperatures were taken twice daily by maximum and minimum thermometer. A continuous record of water temperatures was taken by thermograph at the middle fish ladder. Daily records of weather conditions and streamflows are shown in tables 9-14.

Average daily river discharge data are plotted on figure 3. Maximum daily discharge of 451,900 c.f.s. on June 17 exceeded the 1963 record high discharge of 308,400 c.f.s. which also occurred on June 17.

Maximum water temperature of 64° F. occurred August 18, 22, and 23. In 1963, maximum water temperature of 65° F. occurred August 6-10, 13, 16, and September 6-12.

## ACTIVITIES AND OBSERVATIONS

The waterflow was reduced in the right fish ladder on April 28, 1964, from 9:15 to 11:15 a.m. to clear the submerged orifices and remove accumulated debris. The flow of water was again reduced in this ladder on August 31 from 1:00 to 2:10 p.m. to repair broken chains on an adjustable weir. The left ladder was closed to fish migration on

October 15 to permit repairs to the auxiliary water trash rack and to the diffusion box grating. The middle ladder was inoperative from October 15-24 in order to make repairs.

As part of an evaluation study of effects of Wanapum Dam reservoir encroachment on the ladders at Rock Island Dam, a program of trapping and tagging was conducted by the Bureau of Commercial Fisheries. Chinook were taken in a floating trap at exit of the left ladder, and sockeye were taken by a trap at the counting station inside the left ladder. All fish taken were tagged with numbered Petersen disks and released about 1,000 feet below the dam in equal amounts on each bank of the river. Trapping and tagging was conducted May 19-28 for chinook and July 15 to August 5 for sockeye. A total of 103 chinook and 955 sockeye were tagged and released. Numbers of tagged fish returning through the ladders were: chinook, 92; sockeye, 898.

Two chinook salmon tagged by the Fish Commission of Oregon on the lower Columbia in early spring were observed passing over Rock Island Dam in May.

On several occasions during the counting season, spillway gate operations were changed to improve ladder approach conditions.

During early spring of 1964 and prior to the counting season, modifications were made to the middle ladder auxiliary water supply structure.

Figure 1.--Headwater elevations, Rock Island Dam, May 1 to October 24, 1964.

Figure 2.--Tailwater elevations, Rock Island Dam, May 1 to October 24, 1964.

During 1964, fish were observed with cuts or abrasions on their heads and bodies. Of the 114,439 salmon and steelhead observed as they passed over the counting boards,

2,225 fish, about 2 percent, had injuries (table 21). This same percentage of injuries was noted in 1963. Since in both years the counters could see only the top and one

Figure 3.--Daily river discharge, Rock Island Dam, May 1 to October 24, 1964.

side of each fish, the incidence of injury might have been greater than observed. Of the total number of injured fish observed in 1964, about 56, 23, and 21 percent were recorded in the left, middle, and right ladders, respectively. In 1963, these percentages were 64, 19, and 17. As in previous years, the greatest number of injuries was observed on the large chinook and sockeye salmon. In the 2-week period July 16-31, 52,431 sockeye

were counted through the fishways and injuries noted on about 2 percent of them. In 1963, during the same period, about 4 percent of the sockeye salmon observed had injuries.

Throughout the counting season, State and Federal fisheries personnel made frequent inspections of fishway operations at Rock Island Dam. Inspections were similar to those conducted at other main stem dams where fishways were being operated.

## SUMMARY

1. The total Rock Island Dam count of salmon and steelhead in 1964 was 114,439, about 7,900 more than in 1963.

2. The chinook salmon count of 39,951 (jacks included) was 5,263 more than in 1963, more than two-thirds the peak year of 1957, and exceeded the 31-year average by about 22,600 fish. In 1964, 14,493 jacks were recorded, representing about 36 percent of that year's total chinook salmon counted. In 1963, jacks represented about 56 percent of the chinook run.

3. The sockeye count of 69,411 in 1964 exceeded the 1963 count by 4,643 fish and was 17,808 more than the 31-year mean of 51,603.

4. The coho salmon count of 61 in 1964 was about 75 percent of the 31-year mean of 81 fish and slightly more than 8 percent of the peak year 1962 when 737 were counted.

5. The steelhead count of 5,016 in 1964 was 2,062 less than the 1963 count and 1,559 more than the 31-year mean of 3,457.

6. In 1964, as in previous years, a greater percentage of salmon and steelhead used the

left bank fish ladder than either of the other ladders.

7. Counting began May 1 and terminated October 24. From May 1 through August 31, counting was conducted 16 hours each day; from September 1 through October 10, counting was reduced to 14 hours each day, 6 a.m. to 8 p.m., to conform to hours of daylight available. From October 11 to 24, counting was reduced to one shift per day, 8 a.m. to 4:30 p.m.

8. In 1964, maximum number of salmonids counted in one day (6,866) occurred on July 27.

9. Season's total fish other than salmon and steelhead trout passing Rock Island Dam in 1964 was 118,284, composed of the following: sucker, 84,729; squawfish, 16,854; whitefish, 6,515; chub, 7,868; carp, 621; lamprey, 1,611; Dolly Varden and rainbow trout, 86.

10. Of the 114,439 salmon and steelhead examined, on the top and one side only as they passed over the counting boards, as in 1963 about 2 percent had injuries of some type either on the body or about the head. Most injuries were observed in July and August. Large chinook and sockeye salmon suffered a higher rate of injury than small chinook, steelhead, and coho.

Created in 1849 the Department of the Interior--a department of conservation--is concerned with the management, conservation, and development of the Nation's water, fish, wildlife, mineral, forest, and park and recreational resources. It also has major responsibilities for Indian and Territorial affairs.

As the Nation's principal conservation agency, the Department works to assure that nonrenewable resources are developed and used wisely, that park and recreational resources are conserved for the future, and that renewable resources make their full contribution to the progress, prosperity, and security of the United States--now and in the future.
